Subject: Declaration regarding safety caps used on FILA Solutions packaging

FILA Solutions S.p.A. SB hereby declares that the caps used on FILA Solutions bottles and canisters are equipped with a “Child-Resistant Closure” system (CRC) combined with a “Tamper-Evident” safety system, designed to ensure a higher level of safety during use and to provide evidence of any opening of the product. Due to the technical characteristics of this type of closure, it is completely normal for the cap to appear loose or to rotate partially on itself without immediately unscrewing.

The opening of the container is carried out through the “push down & turn” safety mechanism, which requires the user to press the cap downward while simultaneously turning it.

Therefore, the cap must be considered intact and untampered as long as the lower safety ring (“tamper-evident band”) remains connected to the cap through the original connecting bridges.

The normal rotation of the cap without separation of the safety ring does not constitute evidence of opening, tampering, or product alteration, but is a standard technical feature of this type of safety closure.

We remain at your disposal for any further clarification.

Best regards,

FILA Solutions S.p.A. SB
